

SAASim

Model 001

Measurand's ShapeArray Simulator, SAASim, is designed to provide a low cost accessory to verify your data logger systems. It is not uncommon for the purchased ShapeArrays to be in transit or located at a site away from the office where the logger system is being configured before going out to the field. The SAASim simulates one to many ShapeArrays allowing you to verify your logger hardware and software when the physical ShapeArrays are not available.

The data provided by SAASim is not calibrated and therefore should be used only to verify your logger hardware and program are working.
